SUMMARY

Backend software engineer with 4+ years building microservices, batch data synchronization pipelines, and APIs on AWS using Java, Spring Boot, and Python. Currently ship governance, security, and observability services on Cox Automotive's Snowflake Data Platform, which powers data distribution across every Cox brand. Targeting backend engineering roles building scalable, production-grade systems.

EXPERIENCE

Cox Automotive

Atlanta, GA

Software Engineer II

March 2024 – Present

- Owned and operated production Snowflake governance microservices on the Data Platform serving internal users across data and engineering teams at Cox Automotive, using Java, Spring Boot, AWS (Lambda, EventBridge, S3, EKS), Terraform, Docker, and Python
- Designed an AI troubleshooting Slack bot in Python on the Strands Agents SDK, using RAG over internal sources (GitHub repositories and wikis, SharePoint sites) with Amazon S3 Vectors for retrieval, integrated with a custom MCP server built in FastAPI on Amazon Bedrock AgentCore that queries CloudWatch logs in real time to accelerate on-call incident triage
- Architected an event-driven classification microservice that processes DDL events across roughly 200,000 Snowflake tables, with configurable per-DB/schema/table profiles, readiness gating, async orchestration with retry, and override paths for known classifications
- Built a real-time data pipeline syncing Snowflake to Monte Carlo for over 1,000 datasets, propagating permissions and metadata within minutes and driving platform-wide data quality monitoring adoption
- Redesigned Snowflake temporary and break-glass access, extending supported durations from 4 hours to 2 weeks and adding an independent grant-history audit layer that alerts within minutes on any grant issued outside the approved workflow
- Led rollout of Snowflake network-rule enforcement across 2,000 service accounts, requiring approved network rules for connectivity to restrict access by IP and close a class of network-perimeter risks

FedEx Services

Remote

Full Stack Developer II

February 2022 – March 2024

- Shipped two production full-stack applications - an incident tracking platform and a crisis communications dashboard - using Spring Boot, React, Angular, and Java, serving hundreds of FedEx operations users
- Migrated two Spring Boot services from header-based auth to OAuth 2.0 PKCE flow with Okta, including HTTPS/SSL configuration, key store provisioning, and load balancer setup
- Engineered dynamic search and pagination for the incident-reporting app using Spring Data JPA, enabling operations users to query past entries and build custom reports without engineering involvement
- Integrated Nexus IQ, SonarQube, and Fortify scans into the Jenkins CI/CD pipeline, automating security and static analysis checks to enforce open-source compliance before deploy

TECHNICAL SKILLS

Languages: Java, Python, TypeScript, JavaScript, SQL

Backend: Spring Boot, FastAPI, REST APIs, Spring Data JPA, OAuth 2.0, distributed systems, microservices, event-driven architecture, data pipelines

Cloud & Infrastructure: AWS (Lambda, EKS, CloudWatch, S3, EventBridge, Bedrock, IAM, SQS), Docker, Terraform, Jenkins, GitHub Actions

Databases: Snowflake, PostgreSQL, MySQL

Testing & Code Quality: JUnit, Mockito, SonarQube, Nexus IQ, Fortify

AI/ML: RAG, Strands Agents SDK, Amazon Bedrock, Bedrock AgentCore, Amazon S3 Vectors, Model Context Protocol (MCP), Langfuse

Frontend: React, Angular

EDUCATION

Georgia Institute of Technology

Atlanta, GA

Master of Science in Computer Science, GPA 4.0

May 2026

The University of Georgia

Athens, GA

Bachelor of Science in Biochemical Engineering

2020
